

2018 Per- and Polyfluoroalkyl Substances (PFAS) Results

Harrison Campus

The Michigan Department of Environmental Quality (MDEQ) has begun a statewide initiative to test drinking water from all schools that use well water and community water supplies. The test is looking for a group of manmade chemicals called per-and polyfluoroalkyl substances (PFAS). MDEQ is taking this precautionary step of testing these drinking water sources to determine if public health actions are needed.

It is not uncommon to find low levels of PFAS in drinking water supplies, as PFAS can be found in fire-fighting foams, stain repellants, nonstick cookware, waterproof clothing, food wrappers, and many other household products. They do not break down in the environment and move easily into water.

The EPA set a Lifetime Health Advisory (LHA) level for two PFAS in drinking water, perfluorooctanoic acid (PFOA) and perfluorooctane sulfonate (PFOS). The LHA level is 70 parts per trillion (ppt, equal to 70 ng/L) for PFOA and PFOS combined, or individually if only one is present. The EPA has not set health advisory levels for other PFAS compounds. The State of Michigan is using 70 ppt for decision making purposes.

Mid Michigan College was tested by AECOM, MDEQ's contractor. The test results can be found on the [Michigan PFAS Action Response Team website](#). The results show that of the PFOA and PFOS tested, no PFOS or PFOA were found in the water. The level is below the U.S. Environmental Protection Agency's (EPA) lifetime health advisory (LHA).

Mid Michigan College is committed to providing our students and staff with quality drinking water. As your water supplier, we are working closely with MDEQ to maintain the quality of your water.
